APPROACH WITH MENTOR

- The right to select one's own direction is at the core of our project work – We were free to choose our own topics and to define our own scope.
- Our ideology on how project work is done is based on identifying customer needs, validating our assumption(s) through research and tying our research to actual behaviour of customers.
- Working together to overcome obstacles – We experienced confusion from not knowing where to begin, what timeline to follow or how to implement; this was overcome with the support of constructive feedback and the use of step-by-step checkpoints to ensure we were on the right track.
- The importance of conducting 'real' research vs. taking 'shortcuts' – We were strongly encouraged to conduct 'real' research; visiting stores, conducting primary surveys and identifying real customers' insights versus relying on AI-generated answers.
- The process, discipline and effort required to complete a project is more important than the final grade. The process and effort of completing the project stay with you; the outcome of completing the project is secondary.

Research Aim & Scope

This study examines how digital touchpoints and in-store experiences jointly shape consumer behaviour in Lenskart. The analysis is based on primary survey data collected from 85 respondents and field observations from different stores: Few in south and few in central Delhi. The purpose is to understand how clarity of information, staff interaction, digital tools and store ambience influence purchase satisfaction and recommendation behaviour.

Methodology

- Data were collected using two complementary approaches.
- (1) Survey: A structured Google Form captured behavioural variables including information clarity, digital influence, pricing perception, satisfaction and recommendation intentions.
- (2) Field Observation: Each store was assessed for layout, product placement, diagnostic facilities, staff behaviour and customer flow patterns. The combination of numerical responses and observational insights provides a grounded understanding of how consumers interpret and experience the Lenskart brand.

Digital Consumer Profile (Demographics + Insight)

Survey composition (n = 85):

- Age: 18–24 (68.2%), 24–35 (22.4%), above 35 (4.8%)
- Profession: Students (85.9%), Working professionals (9.4%), Homemakers (4.7%)

Insight:

The survey base is dominated by digitally fluent young consumers who typically begin the buying journey through online browsing. This demographic is more likely to use digital tools such as virtual try-on, filters and comparison features, but they still depend on in-store clinical validation before committing to a purchase.

Clarity of Lens Information (Data + Insight)

Insight:

- A combined 64.7% found the lens explanation clear, yet nearly 10% experienced confusion. This indicates that although the majority receive adequate information, communication is not consistently effective across stores or staff members. Even small lapses in clarity can delay decisions or reduce confidence in the product.

Explanation of Frame-with-Lens Packages (Data + Insight)

Insight:

- Most respondents felt that staff explained package differences adequately. However, the 27% uncertainty+no responses highlight a gap in transparency. Since eyewear involves technical and pricing variations, any ambiguity can weaken trust and influence willingness to upgrade lenses or coatings.

Customer Satisfaction (Eye-Test & Service)

Insight:

- A strong 62.4% rated their experience 4 or 5, indicating that Lenskart's clinical testing and staff service are core strengths. Lower ratings show that roughly one-third of customers still feel uncertain during consultation, often due to unclear communication rather than a lack of equipment or capability.

Digital Influence on Purchase Decision

Insight:

- Digital tools support early-stage evaluation for most customers, reducing uncertainty before store visits. However, digital engagement does not replace in-store validation. Customers still rely on eye-tests and staff explanation before finalising purchases, confirming the importance of an integrated omnichannel model.

38.8%

Found lens clarity **explanation**
very clear

72.9%

Staff explained packages clearly (frame vs lens)
But 10.6% said NO → indicates inconsistency.

62.4%

Rated optometrist professionalism
4–5 stars

Recommendation Behaviour (Loyalty Signal)

- Yes: 47.1%

Shows high trust.

Maybe: 35.3%

Reveals unmet expectations that may lead to brand switching.

No: 17.6%

Reflects confusion or uncertainty during the purchase process, signalling areas where clarity and communication need improvement.

Store Comparison: Premium vs. Non-Premium (Data + Observation)

Premium stores (CP, RK Puram):

- Premium collections placed at the entrance
- Longer, more personalised guidance
- Strong aspirational visual merchandising

Non-premium stores (Uttam Nagar, Dwarka):

- Affordable frames displayed at the front
- Shorter conversations, more price-driven choices
- Despite lower-price focus, diagnostic quality remained identical

Insight:

- Lenskart maintains uniform clinical reliability across all stores, but adapts product placement to local demand. This consistency strengthens brand trust and reduces perceived quality gaps between premium and non-premium outlets.

Key Conclusion

- The study shows that Lenskart's success is driven by its ability to combine digital convenience with medically reliable in-store services. Clarity of information deeply influences satisfaction, and clear explanations directly increase recommendation likelihood. Digital features reduce early uncertainty, but customers still depend on human interaction for final decision-making. Loyalty is shaped less by discounts and more by communication transparency, trust and consistent in-store experience across locations.
