

Corporate Mentorship Programme

Understanding Consumer Behaviour and Digital Marketing Helping Lenskart Growth in the Indian Eyewear Market

Submitted by: -Ankit Kumar

Mentor: Bharat Rampal Sir

Acknowledgement

I express my sincere gratitude to my Corporate Mentorship Programme mentor and faculty for guidance throughout the duration of this academic study. I also extend my appreciation to the respondents who took the time to complete the customer survey and to the frontline staff members at the Connaught Place, RK Puram, Uttam Nagar and Dwarka Lenskart stores for their cooperation during field visits. Without the voluntary participation of these individuals, this report would not have been possible.

Executive Summary

The rapid digital transformation of individual consumer expectations and experiences is a part of the Indian eyewear industry. A good example of how to combine medical reliability with digital retail technology is Lenskart. They provide an integrated approach to eye examinations, personal in-store consultations, online browsing with virtual try-on features and digital ordering, and provide rapid product fulfilment (Lenskart, n.d.). The present study describes primary research only via structured customer surveys conducted via Google Forms and in the field via site visits to four Lenskart retail locations. The results of this research reveal that a variety of factors will affect the way a consumer behaves, including how clear they are on what type of lenses and how well optometrists and store staff explain the frame-with-lens packages, how much digital components created confidence to complete a purchase, and if customers are satisfied to the level of recommending the brand. As seen in the on-site visits, the quality of eye testing and consumers' experiences are consistent across stores. In contrast, the experience in premium stores focused on aspirational visual merchandising, while non-premium stores focus on maintaining affordability through product layout; however, both maintain the highest quality of testing (Lenskart, n.d.).

Introduction

When the Eyewear Industry in India transitioned from the corrective purchase experience to an experiential purchasing process, consumers used only to purchase eyewear when they were experiencing a physical need for corrective eyewear and would make their purchasing decisions based on the trustworthiness of their local optician. With that change, today's customers have changed their purchases to include style, clarity about lens benefits, ordering, and reliability of clinical testing and have an extensive knowledge base of the eyewear industry. Digital marketing and the expansion of the omnichannel retail process are both key areas of influence on the expectations and perceptions of the customer regarding their eyewear purchase experience.

Lenskart has shown that the behaviour of the consumer in the Indian eyewear sector does not happen exclusively through a single channel but rather that the consumer engages with both digital content and a physical experience from an eyewear retailer at the same time. Even though younger customers tend to begin their shopping journey on the internet, a significant percentage go back into the physical store to make their final purchase because they feel confident about the results of a professional eye exam and because of the personal attention received from a professional. Older consumers generally rely heavily on personal interactions in a physical store to assist with their purchasing but also benefit from the use of digital technology that provides consistency among every retail location within the eyewear industry. In this report, we explore and interpret these behaviours through the information obtained from the results of our empirical study, which used data from a Google Form survey and from multiple visits to four different retail store locations.

Research Methodology

This research uses only original sources to gather peripheral information. Quantifiable data are collected using a structured survey conducted using the Google App. The survey provides an opportunity for respondents to express themselves in the following areas: their demographic Group; how well they understand the information presented by Lenskart regarding lenses; the explanation provided by either in-store staff or O&P practitioners regarding pricing and frame-with-lens packages; their overall satisfaction with their shopping experience; the impact that digital features have had in their decision-making process regarding a purchase; and lastly, their willingness to recommend Lenskart to others.

Observational data are collected from four separate Lenskart store locations. These observations were made on the following: how the stores are laid out; the variety of frame styles sold; the composite arrangement of sunglasses; how customers are able to see themselves trying on glasses; the availability of diagnostic equipment; the role(s) of optometrists; observed customer age demographics; patterns of customer interaction with staff; and access to products. These

observations collectively document how Lenskart's omnichannel model operates in the physical store locations.

Overview of the Brand and Market Context

As a digitally supported optical retailer, it has managed to strike a balance between physical and online formats. This means that both the in-store experience and the online experience can work together to enhance each other rather than fight with one another for customers. Lenskart stores are designed around creating a safe haven for people to get their eyes tested and receive advice from staff that they can trust. In contrast, the Digital platform at Lenskart will be all about giving customers freedom and making it easier to review its products before purchasing them. Due to such different approaches, there is a considerable difference between younger customers, who make use of technology to buy things, and those older customers visiting the traditional optician store, who need human contact to help them through a purchase. Lenskart maintains consistency in ambiance, eye-test, and staff support in all four locations to reinforce their brand image and provide an overall positive customer experience. Ultimately, these two points of view directly relate to one of the goals of Lenskart, which is to develop an omnichannel retail strategy.

1. Understanding the Digital Consumer

The Excel sheet's data on customer behaviour provides insight into what today's eyewear customers want when it comes to information clarity, transparency, digital empowerment and confidence when making a purchase. Most of the customers surveyed are represented by young demographics - students & working professionals - who use digital assets to gather information prior to making purchases, indicating that while digital access provides a means for gathering general information related to lenses, it does not enable customers to rely completely on digital access to satisfy their questions related to lens details, but rather continue to rely on 'bricks and mortar' retailers as their primary source of guidance. Additionally, while consumers recommend brands due to the convenience of making purchases online, they also have an incentive to do so if they receive satisfactory personal services.

Although they go in the opposite direction, the field observations agree with the survey. While consumers 50 years of age and older make up the majority of field observations, survey respondents were young consumers who conducted research using digital tools. This implies that while younger consumers use digital channels to expedite their research, older consumers still primarily rely on "bricks and mortar" retailers when making decisions (Lenskart, n.d.). Age is not the only factor that defines digital consumers; respondents' answers to survey questions show that clarity, communication, and support have a greater influence on consumers' confidence than technology independence. As a result, the brand's omnichannel retail strategy successfully serves

customers who want to conduct research online and make purchases offline while still receiving medical-grade assurance in-store (Lenskart, n.d.).

The table below interprets key digital consumer indicators from the Excel sheet:

Indicator from Excel Sheet	Observed Implication for Digital Consumer	Associated Behaviour
Clarity of lens types rating	Consumers seek transparency and simple explanations	Higher clarity → higher satisfaction
Explanation of pricing and packages	Determines trust and comfort during billing	Clear explanation → confidence
Satisfaction score	Integrates digital and physical expectations	High satisfaction → likelihood to recommend
Influence of digital features	Supports decision-making but does not replace eye test	Digital influence → moderated trigger
Recommendation intent	Primary indicator of loyalty and advocacy	Yes → strong brand belief

The consumer who uses Lenskart's services expects to have the freedom to make decisions, and that they will receive reasonable assistance (both "clinical" and "interpersonal") as needed. While older customers primarily rely on the in-store staff and optometrists and do not use the application or website as a resource, younger customers benefit from digital information that enhances their in-store learning experience.

According to the behavioural data gathered, consumers' use of digital services to support their journey is greatly aided by clear information. According to survey results, not all consumers are completely aware of things like progressive lenses, anti-blue cut, and anti-glare. When information is presented clearly, customers are more satisfied and feel more comfortable recommending Lenskart to other customers. Customers are less satisfied and plan to refer fewer people when information is presented in an unclear manner. The results show that consumers evaluate the depth of information even though depth of vision for frames is still a major concern for digital consumers. Additionally, the shift to digital services has made consumers more knowledgeable and curious; instead of just accepting that someone has given them a service, they now ask why and how it will help them.

The observations from the stores reinforce the patterns identified in the survey. A large number of older customers engaged in detailed conversations with store staff and optometrists about lens types, frame durability, pricing differences and coating benefits. Rather than making decisions purely on the basis of appearance, these customers wanted explanations that linked the medical need for a particular lens to its overall value and suitability. Whether interacting through digital platforms or speaking directly with staff, customers consistently expected product information to be clear, concise and easy to understand.

These findings also broaden the definition of a “digital consumer.” The demographic contrast between younger survey respondents and older retail customers shows that digital adoption does not refer only to the use of mobile apps. It also includes consumers whose expectations are shaped by a blend of technological comfort, trust in expert guidance and reassurance that the product will address their visual needs. Lenskart’s business model is well positioned to support both ends of this spectrum, as long as it maintains strong communication practices that make all customers regardless of age or familiarity with technology feel informed and confident in their decisions.

2. Digital Market Research and Data Analytics

The survey's results offer an empirical market research tool for comprehending customer satisfaction, expectations, and willingness to promote the business. Additionally, this Digital Marketing Research project offers market research insights regarding five important areas of Digital Marketing Research by examining Values analyzed through the Variable Analysis of the Survey Excel Data Spreadsheet: Clarity of Information Provided; Employee Credibility in Describing Products/Services; Value Perceived in Using Digital Tools; Customer Satisfaction Level; and Total Propensity to Promote/Recommend the Business.

The table below demonstrates how the Excel variables translate into actionable digital market insights:

Survey Variable	Insight Generated	Usefulness for Market Research
Clarity of information about lenses	Determines whether communication is understood	Can guide revision of visual aids and staff training
Explanation of frame-with-lens packages	Indicates whether billing transparency exists	Can reduce purchase hesitation through pricing clarity

Survey Variable	Insight Generated	Usefulness for Market Research
Satisfaction rating	Reflects broad service experience	Helps evaluate operational consistency
Influence of digital features	Shows the strength of virtual try-on and browsing	Helps decide future digital investments
Recommendation behaviour	Primary indicator of loyalty	Predicts organic brand growth

The feedback from these variables creates a mechanism to improve a business utilizing both digital and physical retailing methods. By collecting survey responses through Google Forms the collected results provide a valid and analysable method of identifying where customer behaviour gaps reside. The business can then develop the right tools to enhance their visibility (visual charts, pamphlets, etc.) if the Clarity Ratings of the survey are low. If the Satisfaction ratings demonstrate a plateauing effect, even after digital engagement has occurred, the business may want to explore ways to align the expectations between customer service and the promises made digitally. Through observations made from store visits, it has been determined that Factors such as Medical Accuracy, Time Allocation of Staff, and Layout of Physical Stores significantly affect Perception. The findings related to Premium and Non-Premium Test Outlet Re-testing levels between stores show a positive operational benchmark for TPs across each outlet type. Therefore, Digital Market Research is the link between making physical improvements to bricks-and-mortar businesses; consumers interpret how a store is performing based upon their digital and Social Media Expectations.

The survey confirms that Data-Driven Feedback is foundational to establishing Sustainable Digital Brands. When the variables collected in the Excel Dataset are analysed as measurable behavioural indicators, rather than simply opinions, they form a structured foundation for Continuous

Business

Improvement.

3.Content Strategy and Digital Engagement

Whether customers interact with the brand online or in a physical store, what truly shapes their opinion is the quality of information they receive. The survey results make this very clear. People were not judging the experience based on how many posters or product boards they saw they were judging it based on how well someone explained the differences between lens packages and what each option actually meant for them. The dataset showed three kinds of reactions: some customers felt the explanation was extremely clear, some understood only parts of it and others were still unsure even after speaking to staff. This suggests that information is not always

communicated in the same way across stores. It also shows that customers form their opinion based on how well they understand the explanation, not simply because information exists in the store.

Feedback about the frame-and-lens combination followed a similar pattern. If the pricing structure and package breakdown aren't explained well, customers struggle to choose confidently. Confusion leads to hesitation, and hesitation can result in dissatisfaction. Interestingly, customers did not blame the machines or technology for this confusion. They focused on how the information was presented. Clear, simple, and confident guidance from staff made customers feel assured, not the presence of expensive equipment.

Digital tools also played a role in the decision-making process. However, survey responses indicated they were more of a support than a driving factor. Some customers used virtual try-on, some browsed online, and others relied on the mobile app before visiting the store. Yet, using these tools didn't automatically make customers feel comfortable enough to make a purchase. The tools helped people become familiar with their options, but their final confidence came from clear explanations from store staff about what they were buying and how it met their needs.

The table below presents content-related implications derived strictly from the Excel sheet variables:

Excel Variable	Interpretation	Content Strategy Implication
Clarity of lens information	Mixed clarity reported	Improve visual diagrams and reduce technical complexity
Explanation of packages	Variability in understanding	Introduce simplified pricing boards and scripted communication
Influence of digital features	Mixed reliance	Promote digital tools as support rather than replacement
Satisfaction rating	Linked to clarity levels	Standardise content delivery for uniform experience
Recommendation behaviour	Highest in respondents with clarity	Content quality drives advocacy and retention

Content strategy is not only about how information looks on the screen or on a brochure, but also about how customers receive it, make sense of it and remember it later. The survey results make this clear: when information is communicated in a simple and understandable way, customers

feel more satisfied and develop stronger trust in the brand. The same trend appeared during store visits. Whenever optometrists explained lens details in a straightforward and organised manner, customers had fewer follow-up questions and made purchase decisions with more confidence. This shows that customers do not view the buying process as a quick transaction; instead, they see it as a shared decision where they rely on trained professionals to guide them.

The difference in communication style across the four stores highlighted this point. At the Connaught Place and RK Puram locations, staff spent more time discussing the benefits of coatings. They explained frame suitability and helped customers consider their lifestyle needs. These longer conversations led to stronger engagement. At Uttam Nagar and Dwarka, the talks were shorter and more focused on price, making interactions feel more transactional. Despite these differences, one expectation was consistent: customers wanted clear, practical explanations without unnecessary technical language.

Digital tools are part of this learning process, but they support rather than replace in-store interaction. Virtual try-on features, search filters, and reviews help customers explore products ahead of time. However, they cannot match the reassurance that comes from a medically reliable eye exam and a clear explanation from a staff member. What matters most is consistency. Whether a customer browses on the app or talks to someone in the store, the tone and clarity of information should be the same.

When this consistency is present, customers start to trust the brand. Trust influences whether they recommend the brand to others. If customers are confused about pricing, packages, or what they are actually paying for, they are less likely to share positive feedback. This shows that content is not just a way to provide information; it also builds credibility. By keeping explanations clear, professional, and consistent throughout the buying journey, Lenskart can use its content strategy to foster long-term customer loyalty.

4. Social Media Strategy and Community Building

In the Excel dataset, the question that best relates to building a community through social media is the one that asks whether customers would recommend Lenskart to others. Recommendations now go beyond telling a friend in person; they can include online reviews, ratings, comments, posts, or any type of user-generated content. Because of this, a customer's willingness to recommend the brand also serves as a measure of brand advocacy. This advocacy plays an important role in shaping a digital community around the company.

Customers who selected "yes" in the survey are clearly satisfied with their experience and feel confident enough to speak positively about the brand. For them, Lenskart has provided an "experience worth sharing." The "maybe" category falls into a different behavior zone. These

customers are not dissatisfied, but something prevents them from promoting the brand openly. Their willingness to recommend often relies on specific triggers, such as being asked for their opinion, receiving a discount, or finding the purchase particularly convenient or affordable. In contrast, the “no” responses indicate a break in the customer journey. These individuals are either disengaged or still unsure about what they purchased. When someone hesitates to recommend the brand, it usually means that an important part of the buying process was unclear or did not feel valuable enough, especially regarding pricing or product explanations.

The use of QR codes for feedback in physical stores shows that Lenskart already collects offline customer responses and links them with digital reputation-building mechanisms. The QR system invites customers to provide product ratings and share their experience online, acting as a bridge between the physical retail experience and digital community formation. In other words, the QR code serves as a formal channel that connects an in-store purchase with digital interaction.

Field observations further show that the prominence of QR codes varied by store. At Connaught Place and RK Puram, QR signage was highly visible at the payment counters, signalling a stronger push toward digital engagement and feedback. Uttam Nagar and Dwarka also had QR signage, but it was less prominent and therefore less likely to influence customer behaviour in the same way. Its physical presence may thus have contributed to an increase in the volume of product ratings that customers submit via OPP accounts.

A summary of community-building indicators is presented in the following table, along with an interpretation based on survey results.

Survey Variable	Interpretation	Implication for Social Media Community
Recommendation behaviour	Yes → high advocacy, Maybe → moderate, No → low	Advocacy can serve as user-generated promotion
Influence of digital features	If digital experience is helpful, advocacy increases	Digital UI affects likelihood of sharing opinions
Clarity and explanation	Higher clarity → higher recommendation	Communication quality indirectly affects online image
Satisfaction rating	High satisfaction encourages online loyalty expression	Positive experience fuels review-based awareness

This heading demonstrates that social community does not rely on explicit social media usage questions; instead, it relies on whether a brand experience is strong enough to be shared voluntarily. The Excel dataset clearly shows that the pathway from clarity to satisfaction and from satisfaction to advocacy is linear.

Source: Primary consumer survey (Excel dataset).

5. Digital Branding and Consumer Perception

Branding digitally involves how your customer's experiences as they traverse various channels contribute to forming what your customer thinks about your brand; so while branding is a conclusion derived from customer interaction with a company's visual identity, promotional message and, most importantly, how customers perceive the company on an ongoing basis from those same interactions that create the brand perception. In the Excel data, perceptions of a particular brand were created by measuring four items (i.e. clarity, explanation, satisfaction and recommendation) and having consumers stating clarity as an area of excellence, along with providing high ratings for their satisfaction levels, would create positive perceptions of a company brand. However, if any responses reflect confusion on price and/or package explanations, they may weaken the perceptions of a brand, regardless of how appealing the frames may be or how convenient the digital tools are to use, etc. My field observations confirm this; I found that regardless of the store location, the stores had identical eye testing machines, store layouts, lighting, product divisions/tags and store uniforms, which have built a perception on professionalism as a brand within the optical industry. The premium stores (Connaught Place/RK Puram) had prominent or aspirational placements that were key components to providing each premium store with an exclusive branding opportunity; the discount stores (Uttam Nagar/Dwarka) desired to create easy access to discount racks/sections that were presented with value-oriented merchandising. Even though the two types of stores had their own individual type of merchandising, they both have established an organised, technologically enhanced, branded image in optical retailing.

The implementation of smart glasses within Uttam Nagar has demonstrated that technology has the potential to promote brands beyond just high-end, luxury style, but also within social responsibility. In the same way that a staff member with a disability reflects a company's commitment to having an inclusive workplace culture, the fact that there are female employees working in the Dwarka store suggests that there is a diverse and welcoming environment. The combination of these strategic business choices show that digital branding is not strictly online, as it can be represented through the store's atmosphere; in-store marketing; the conduct of sales staff; and the availability of products. Following is a summary of the different aspects of digital branding identified in the survey and from personal observations.

Variable / Observation	Interpretation	Branding Implication
Satisfaction rating	Satisfaction reveals alignment between expectation and experience	Positive satisfaction strengthens brand image
Clarity and explanation	Determines whether the brand appears trustworthy	Transparency increases perceived reliability

Variable / Observation	Interpretation	Branding Implication
Recommendation behaviour	Indicates emotional connection with brand	Advocacy builds digital credibility
Consistent store layout	Standardised brand identity	Reduces risk of perception mismatch
Diversity and inclusion in stores	Staff composition influences goodwill	Supports socially responsible branding narrative
Availability of smart eyewear	Modern, tech-forward brand orientation	Attracts younger and aspirational consumers

Digital branding in the context of this study is therefore not a function of campaign design but of consistent delivery of clarity, professionalism and trust across touchpoints.

Integrated Interpretation of Graphs and Images

This section offers an academic look at what the charts and photo evidence reveal about consumer behaviour when buying eyeglasses through Lenskart's online and offline model. The first two charts, "Clarity" and "Explanation of the Frames with Lenses," illustrate the basic factors influencing consumers' decisions to purchase eyewear. The main factor in their choice is the flow of information from the brand to the consumer. Consumers who rated the clarity of a brand's lens highly were also the most likely to recommend that brand. Data from the Excel spreadsheet indicates that clarity is not just a nice aspect to consider for customer satisfaction; it is the key factor that influences it and should be prioritized when assessing customer satisfaction. Consumers who reported confusion in either area were much more hesitant to give a "neutral" recommendation or to promote the brand. This relationship shows that a customer will only recommend the brand if they fully understand what they are buying..

The third chart, "How Digital Affects My Decision to Buy," shows that while digital marketing may have a positive effect on a customer when deciding to purchase, it needs to be supported/complimented by an in-person consultation/testing with an optometrist. Customers who were affected by the use of digital (virtual try on, etc.) were still relying on the in-store consultation/testing provided by the merchant. Consequently, the use of digital affordances will instil pre-purchase confidence and reduce post purchase uncertainty. Even though customers might use digital tools before going to the store, medical validation and personal conversations remain the most important factors in making a final decision about eyewear. In this detailed

purchasing process, Lenskart has managed to link online research with expert guidance in the store. This creates an experience that feels both easy and trustworthy for customers.

The fourth chart reveals an important insight about the link between satisfaction and recommendation behavior. A satisfied customer does not automatically become someone who recommends the brand. True satisfaction happens when staff take time to answer questions clearly and patiently. It is not enough to simply show customers a large selection of frames or attractive prices. Customers who leave the store with a clear understanding of their purchase are much more likely to recommend the brand to others. On the other hand, those who feel only "somewhat satisfied" often hesitate to make recommendations. This highlights that satisfaction is the foundation for building a digital community around the brand. In today's digital landscape, where reviews, shared experiences, and user-generated content shape credibility, customer satisfaction directly affects how the brand is viewed online.

The store photographs support this conclusion and show a similar pattern. At all four locations, the visual setup stayed the same: bright lighting, open and accessible frame displays, and diagnostic areas that were easy for customers to see. These features create a professional and trustworthy atmosphere. Keeping the same visual standard across locations also stops customers in non-premium areas from feeling like they are getting a lesser version of the brand. The images further highlight Lenskart's segmentation strategy. Premium stores display high-end frames at the entrance to appeal to aspirational buying behavior, while non-premium stores feature affordable frames at the front. Even with these differences, the diagnostic technology and interiors were nearly identical at every outlet. This shows that Lenskart adjusts product display to meet local market needs without losing its core values, which helps the brand build trust among a diverse range of customer groups.

When the survey charts and the store photographs are considered together, a clear pattern becomes visible. Customer satisfaction and their willingness to recommend the brand are largely driven by three factors: how clearly information is communicated, how confident they feel about the medical testing process and how consistent the store environment is across locations. Digital features allow customers to browse and compare products in advance, but they cannot replace the clarity that comes from human explanation. Customers still depend on staff to validate what they saw online and to assure them that they are making the right decision. In the end, the trust that leads to recommendations comes from clear communication and reassurance rather than technology alone.

Discussion

The combined insights from the survey and the field visits make it clear that Lenskart's growth is not driven by a single aspect of digital marketing but by multiple interconnected factors. Survey

results show that today's digital consumer expects clarity in pricing, simple explanations of lens options and easy access to information before making a purchase. Field observations add context to this finding by showing how the company translates digital elements into an enjoyable in-store experience through strong lighting, product accessibility, helpful staff behaviour and a smooth transition from frame trials to eye testing.

Several broad themes emerge from the dataset. First, as consumers become more digitally aware, their relationship with Lenskart extends beyond using online tools; the digital journey continues inside the physical store. This is reflected in the strong correlation between clarity scores and satisfaction customers expect the retail store to match the quality of experience that the website or app promises. Second, digital market research and analytics play a real role in shaping operations. The Excel data shows that a small set of questions is enough to measure customer experience and predict long-term loyalty. If tracked regularly, these indicators can help the business turn customer feedback into operational improvements.

Content strategy should be seen as something that influences how customers behave, not just as a marketing message. In eyewear, people are not looking for persuasive language; they want clear and dependable facts so they can make the right decision. Confidence develops most strongly when a staff member explains lens features in simple, straightforward terms. This type of clarity builds trust far more effectively than price drops or attractive displays on their own. The same applies to community building. A loyal customer base does not form just because a brand runs campaigns it grows when customers genuinely feel satisfied enough to talk positively about their experience. Word-of-mouth happens naturally only when the overall buying journey is smooth and reassuring. Even the best referral schemes or contests cannot create advocacy if the core experience is weak.

A major part of digital branding depends on keeping the retail environment consistent, not just promoting the brand through advertising. The store photographs illustrate that every outlet delivers the same polished and professional ambience, regardless of whether the store is in a premium or non-premium locality. This consistency helps customers feel confident that the brand can be trusted no matter which store they visit. The use of modern diagnostic equipment and inclusive hiring further strengthens this perception by showing that Lenskart prioritises customer care from medical, social and service perspectives not only from a commercial standpoint.

The overlap between the survey results and the store observations shows that customers do not act differently online and offline. Digital interaction creates expectations, and customers evaluate the in-store experience based on whether those expectations are met. When product details and pricing are explained clearly, customers develop trust and are more inclined to recommend the brand. However, if confusion arises at any stage whether due to unclear medical terminology or a complicated package structure satisfaction drops and recommendations become unlikely. This

makes it clear that Lenskart's competitive strength is not just its technology, but its ability to deliver a consistently smooth and reliable experience for every customer across all touchpoints.

Digital transformation in the eyewear sector is not simply about shifting purchases to online platforms. Its real purpose is to give customers the confidence to make informed decisions by providing dependable information, allowing them to test products in person and building long-term trust in the brand. Lenskart reflects this approach by blending digital tools with in-store consultation rather than treating the two as separate paths. The Excel findings reinforce this point. Customers who used virtual try-on or other digital features before visiting the store shared that these tools helped reduce uncertainty early in the buying process. At the same time, those customers also highlighted how important it was for staff to explain both medical details and pricing in person. This shows that technology and human support do not replace each other — they work together.

The study ultimately shows that customers today approach eyewear purchases much more thoughtfully than they once did. Instead of buying impulsively, they weigh the value and personal benefit of the product before committing. The survey responses clearly indicate that customers prefer to be informed rather than convinced, and having strong product knowledge plays a key role in building trust and improving marketing outcomes. Of all the behavioural indicators measured, recommendation emerged as the most influential. A "Yes" response reflects solid confidence in the brand and a willingness to speak positively about it in social or online settings. A "Maybe" suggests that the customer's expectations were only partly met, and a "No" highlights gaps in the experience that prevent advocacy altogether. Therefore, recommendation is not just a by-product of satisfaction it signals the likelihood of future loyalty and reflects how strong the brand is against competition.

Conclusion

This CMP study on Digital Marketing and Consumer Purchase Behaviour for Lenskart is grounded in insights gathered from a Google Forms Excel spreadsheet and systematic field observations across four stores. Together, these sources offer evidence that helps explain how Lenskart continues to grow within the Indian eyewear market.

Evidence shows that convergence exists between Medical Reliability, Well-structured Information, Ease of Use (of the Digital), and the Interpersonal Trust in yielding Customer Satisfaction and Advocacy. Consumers are not entirely Digital nor Traditional; they depend on Product Claims via Online Channels to justify their purchases with the help of the Optical Test and Personal Consultation experience. Moreover, the Excel Dataset shows that Clear Information provided to Consumers and that the Staff can Offer Clear Information and Detailed Explanations

about the products of Lenskart is the highest contributing factor to both Customer Satisfaction and Customer Advocacy.

Moreover, the Field Observations confirm that the lenskart brand is viewed positively at different locations based on consistent positive findings of store aesthetics, precision of optical testing, access to doctors, and responsiveness of the staff. The integration of both physical and digital features marks the top advantage of Lenskart over its competitors. While digital features grant customer interest, reduced risk, and a chance to consider other brands in the market, physical stores give customers confidence in the brand through a medical professional's validation and the support of friends and family members. When both types of features exist together, customers become brand advocates and recommend it to their personal networks. For this reason, digital marketing should not be considered as a replacement for the in-store experience, but rather a complement.

Recommendations

The following recommendations are based strictly on the quantitative data obtained from the Excel survey and the qualitative data obtained through visits to the stores.

1. Ensure that the explanatory materials for all the stores are standardised. Because the Excel data set showed a wide range in clarity amongst the various shops, the first recommendation is to create simplified visual representations of the various types of lenses and frames as well as a standardised structure of the communication scripts used in practice when discussing pricing for lens/frame packages.

2. Increase reinforcement of the educational material available in the stores. The data shows that consumers have a highly dependent relationship on the information available to them. By providing post-eye-test educational summary sheets (paper or digital) for consumers to reference, you can improve the consumer's trust level in their own decisions and increase transparency in the decision.

3. Increase promotion of the use of digital tools within the stores. Many survey participants indicated that they felt digital tools had added value, but there was not universal adoption of digital tools. By demonstrating virtual try-on tools to older customers in a brief demonstration, you could increase usage and reduce apprehension.

4. Focus on clarity over discount-based selling. The data shows that there is agreement between the results of the survey and the results of the industry that a transparent explanation is more effective than a monetary discount incentive for building customer satisfaction and loyalty.

5. Continue promoting an inclusive tech-forward brand image in the non-premium retail locations. The visibility of smart eyewear and the inclusiveness of staff members contribute to a consistent branding message and good will within the business community. All of the recommendations above are pragmatic, show evidence, and were made based on the variables included in the data set and the results of our observations during our store visits.

Limitations of the Study

There are some Limits in this research based on the collection of Primary Data as well as the Survey Response Grouping Process. The survey represents only those respondents who have accessed the Google Form and submitted their answers. Therefore, it does not provide an accurate representation of the demographics of all eyewear consumers in the marketplace. The stores selected for observation were located in four urban areas in Delhi and, therefore, do not provide a representative sample of the behaviours and purchase trends seen within rural and Tier 2 City consumers. The analysis will not include secondary statistics, competitor behaviours or financial information. The researcher designed this study to remain exclusive to identifying the results given from both the survey results and the field research findings. With these limitations, the research maintains internal and reliability based on solely observable and measurable data and findings.
